AAV27641-751 represent immunostimulatory oligodeoxyribonucleotides (ODNs) of the invention. The ODNs contain at least one unmethylated CpG dinucleotide, and have the formula: 5' NIXICGX2N2 3', where at least one nucleotide separates consecutive CpGs, X1 is adenine, guanine, or thymine, X2 is cytosine or thymine, N is any nucleotide and N1+N2 is 0-26 bases with the provision that N1 and N2 does not contain a CCGG tetramer or more than one CGG or CGG trimer OR 5' NIXICACGX3X4N 3', where at least one nucleotide separates consecutive CpGs, X1 and X2 are selected from GpT, GpG, GpA, ApT and ApA, X3and X4 are selected from TpT or CpT, N is any nucleotide and N1+N2 is 0-26 bases with the provision that N1 and N2 does not contain a CCGG tetramer or more than one CCG or CGG trimer. The ODNs activate lymphocytes in a subject and redirect a subject's immune response from a Th2 to a Th1 (e.g. by inducing monocytic cells and other CC cells to produce Th1 cytokines, including IL-12, IFN agamma and GM-CSF). The ODNs can be used to treat or prevent an asthmatic disorder, a utoimmune diseases, in desensitisation therapy, as an artificial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                    New immunostimulatory nucleic acid molecules - which contain at least one unmethylated CpG dinucleotide, used for treating e.g. tumours, infections

                                                                                                                                                                                                      method for enhancing the immunostimulatory effect of an antigen encoded by nucleic acid contained in a nucleic acid construct. The method in involves determining the CpG-N and CpG-S motifs present in the construct, removing neutralising CpG (CpG-N) motifs and optionally inserting stimulatory CpG (CpG-S) motifs in the construct, thereby producing a nucleic acid construct having enhanced immunostimulatory efficacy. The method can be used for immunisation against viral antigens, e.g. from hepatitis B virus (HBV), bacterial antigens or an antigen derived from a parasite. They can also be used for expression of a therapeutic polypeptide, e.g. growth factors, tumour suppressors, cytokines, apoptotic proteins, interferons, hormones, clotting factors, ligands and receptors. (Updated on 20-MAR-2003 to correct PA field.)
                                                                                                                                                                                          AAV74237-V74253 are oligodeoxynucleotide (ODN) primers used to describe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              B cell; stimulant; immune response; B cell activation; cancer; vaccine; immunostimulatory molecule; infection; therapy; 88.
                                              Use of neutralising CpG and stimulating CpG motifs in DNA vectors - for enhancing the immunostimulatory effect of an antigen or enhancing the expression of a therapeutic polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                           This sequence represents a B cell stimulatory oligonucleotide. The invention relates to compositions comprising an oligonucleotide (I) with unmethylated guanine and cytosine nucleotides and an antigen in a carrier. The oligonucleotides can be administered to a subject in a composition with an antigen in a carrier to enhance an immune response by and can be used to treat, prevent or ameliorate an immune system and can be used to treat, prevent or ameliorate an immune system deficiency e.g. cancer or viral, fungal, bacterial or parasitic infection. They can also be administered as a vaccine adjuvant to stimulate the response of a host to a vaccine. The compositions can be used to treat humans or vertebrate animals including dogs, cats, sheep pigs, cows, goats, chickens, mice and monkeys. Preceding chemotherapy with the immunostimulatory oligonucleotides should be useful for
                                                                                                                                                    Immunostimulatory oligonucleotides which enhance B cell activation useful for treating an immune system deficiency e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Oligodeoxyribonucleotide; ODN; cytosine-guanine dinucleotide; CpG; immunostimulatory; therapy; immune system deficiency; tumour; cancer; antibacterial; antiparasitic; fungicide; antiviral; cytostatic; leukaemia; systemic lupus erythematosus; sepsis; autoimmune disease; immunoinhibitory; ss.

The present invention relates to immunomodulatory oligodeoxyribonucleotides (ODMs) containing methylated or unmethylated represents a compositions having unmethylated CpG dinucleotides. Immunostimulatory ODN compositions having unmethylated CpG dinucleotides are useful for activating lymphocytes and for treating, preventing or ameliorating an immune system deficiency e.g. tumour or cancer or viral, fungal, bacterial or parasitic infection and leukaemia. Neural ODN that contains a methylated CpG dinucleotide are useful for treating diseases such as systemic lupus erythematosus, sepsis and autoimmune diseases. Immunoinhibitory ODN Gontaining CpG dinucleotides that are not in the stimulatory motif and activity. The present sequence is an immunostimulatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  anti-parasitic;
                                                                                                                                                                                                                                                                                                                                                                         Immunostimulatory composition useful for stimulating immune response in subject, comprises antigen and immunostimulatory nucleic acid comprising oligonucleotides having unmethylated cytosine-guanine dinucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            88

                                                                                                                                                                                                                      response. The method comprises administering an immunostimulatory uncleic acid to a non-rodent subject in sufficient quantity to stimulate an immunostimulatory nucleic acid. The present sequence is one such immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects adding tumour antigens, viral antigens (e.g. herpesviridae, retroviridae, and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is staphylococcus, preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the
                                                                                                                            Vaccinating against tumors, infectious diseases, allergies and asthma using immunostimulatory Py-rich and TG nucleic acids.
                                                                                                                                                                                                            present invention relates to a method for stimulating an immune

                                                                                                         The invention relates to inhibiting angiogenesis in a subject, comprising administering at least one antiangiogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lession, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, osler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic
Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to methods for treating or preventing cancer, involving administering to a subject having or at risk of developing cancer immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies. The methods are useful for treating or preventing cancer such as basal cell carcinoma, bladder

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to treating a subject infected with HIV comprising administering a CpG nucleic acid (e.g. an adjuvant type CpG obligonuclectide, an immunostimulatory CpG oligonuclectide or a B cell stimulatory CpG oligonuclectide). The CpG are used as gene therapy vaccines to treat a subject infected with HIV. The present sequence is a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Treating a subject infected with HIV by administering a CpG nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic context dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                   Immunostimulatory, antiinflammatory, dermatological, antipsoriatic; antiulcer; gene therapy, vaccine; non-allergic inflammatory disease; psoriasis; eczema; allergic contacticis dermatitis; latex dermatitis; inflammatory bowel disease; ulcerative colitis; Crohn's disease; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Treating non-allergic inflammatory diseases, such as psoriasis, ecz allergic contact dermatitis, latex dermatitis or inflammatory bowel disease by administering an immunostimulatory nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        asthma which comprises administering to a subject a poly G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                           Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method of treating or preventing allergy or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              요
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         systemic lupus erythematosus (SLE), sepsis, or cancer. The coligonucleotides are safe to use since they do not initiate an immune reaction when administered to a subject in vivo. ACAG2324-ACAG2352 represent the immunomodulatory oliuponucleotides of the invention. Note: The present sequence given as SEQ ID No:1 in the Sequence listing differs from that given on page 6 (ACAG2351) and page 17 (ACAG2352) of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel immunostimulatory oligonucleotide comprising 2-100 nucleotides and containing at least one unmethylated CpG dinucleotide, useful for activating a subject's B cells or natural killer cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to immunostimulatory oligonucleotides containing at least one unmethylated CpG dinucleotide, and immunoinhibitory oligonucleotides which are capable of interfering with the activity of viral or cellular transcription factors. The immunostimulatory oligonucleotides are useful for activating a subject's lymphocytes (B cells or natural killer (NK) cells). They are useful for treating, preventing or ameliorating an immune system deficiency. The immunoinhibitory oligonucleotides are useful for treating or preventing viral infection in a subject. They are also useful for treating or yeroenting or viral infection in a subject. They are also useful for treating or immune system deficiency in a subject. The immunoinhibitory oligonucleotides can be used in a pharmaceutical composition which may be used for vaccinating an subject. The oligonucleotides may be used for treating an immune disease such as

                                                                                                                                                                                                                                                              The present invention provides oligonucleotides comprising unmethylated CpG dinucleotides. The invention is useful to activate lymphocytes specifically to activate B cells and natural killer cells, for treating diseases associated with an immune system activation such as systemic lupus erythematosus, sepsis and viral infections. The invention is useful
                                                                                                                                                                                                                                                                                                                                         as an immunosuppressive, immunosimulating, immunomodulating, antibacterial, antiinflammatory, dermatological and virucidal agent. The present sequence is a mitogenic oligonucleotide used in the stimulation of B-cells. This sequence is used in the invention.
                                                                                                                                                                         New immunomodulatory oligonucleotides containing at least one unmethylated CpG dinucleotide, useful for treating diseases including systemic lupus erythematosus and sepsis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  .

```
The invention relates to a new oligonucleotide which: (a) comprises about CC 2-100 nucleotides and containing at least one unmethylated CpG dinucleotide, or (b) is capable of interfering with the activity of viral or cellular transcription factors and containing a consensus immunication or melicial or cellular transcription factors and containing a consensus immunoinhibitor CpG motif represented by the formula (1): 5/GCXnCCG3/
CW ancleotide and no 1-50. Also included are an oligonucleotide and a capable composition comprising the oligonucleotide and a largering means, calls (by contacting the calls with the oligonucleotide and a subject (by pharmaceutical carrier, activating a subject's B cells or natural killer cells (by contacting the colloquicleotide) treating, contrating or ameliorating) an immune system deficiency in a subject, when a vaccine, treating a disease associated with an immune collomic or auchioaction in a subject (by administering the composition in conjunction with a pharmaceutical carrier), an improved method for in vivo diagnoses using oligonucleotide probes comprising methylating CpG containing oligonucleotide probes comprising methylating CpG containing oligonucleotide probes comprising or method for in vivo diagnoses using oligonucleotide probes comprising or method for in vivo diagnoses using oligonucleotide probes comprising an immune system deficiency, such as systemic lupus erythematosus, sepsis, tumour, cancer, or viral, fungal, bacterial or parasitic infection.

C compositions comprising the logionucleotide are useful for treating a subject.

The immunoshibitory oligonucleotide is useful for treating or preventing or viral infection in a subject. The oligonucleotide is useful for creating are useful for creating or preventing or viral infection in a subject. The oligonucleotides may also be used in composition with a vaccine to boost a subject's immune system to effect a conjunction with a vaccine to boost a subject's immune system to else on the malignant cells to subminish or for 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .

The invention relates to oligonuclectides containing at least one unmethylated CpG dinuclectide. The invention relates to an oligonuclectide delivery complex comprising an oligonuclectide of the invention and a targeting means, a method of activating a subject's B cells or natural killer cells by contacting the cells with an immens system deficiency in a subject, vaccinating a subject by administering the composition in conjunction with a vaccine, a method of treating a disease associated with an immune system activation in a subject by administering a neutral oligonuclectide alone or in conjunction with a pharmaceutical carrier, and a method of performing a neutral oligonuclectide alone or in conjunction with a pharmaceutical carrier, and a method of performing antisense therapy comprising methylating CpG containing oligonuclectides are useful for treating diseases associated with immune system activation, such as systemic lupus erythematosus and sepsis. Compositions comprising systemic lupus erythematosus and sepsis. Compositions comprising a subject's B cells or natural killer cells, for treating a subject the invention are useful for activating a subject of an immune system deficiency or for vaccinating a subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      immunoinhibitory oligonucleotides are useful for treating or preventing a viral infection in a subject. The oligonucleotides may also be used in conjunction with a vaccine to boost a subject's immune system to effect a better response from the vaccine, or for increasing the responsiveness of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cells to subsequent chemotherapy. This sequence represents an

Steinberg AD; Krieg AM, Klinman D,

WPI; 2004-624263/60.

New oligonucleotide comprises at least one unmethylated CpG dinucleotide, useful for stimulating an immune response or for treating diseases associated with immune system activation, e.g. systemic lupus erythematosus or sepsis.

Claim 5; SEQ ID NO 1; 19pp; English.

This invention describes novel oligonucleotides capable of interfering with the activity of viral or cellular transcription factors and containing a consensus immunoinhibitory CpG motif having the formula: CCGXAGCG3', where X is a nucleotide and n is 0-50 and a phosphorothioate backbone modification. The invention also describes an oligonucleotide delivery complex comprising the oligonucleotide and a targeting means e.g. a pharmaceutical carrier. The oligonucleotide and targeting means e.g. a pharmaceutical carrier. The oligonucleotide and targeting a subject's Beels or natural Killer cells; reating, preventing or ameliorating a disease associated with an immune system activation in a subject (systemic lupus erythematosus or sepsis); performing antisense therapy comprising methylating CpG containing oligonucleotide prior to administration to a subject; and treating oligonucleotide probes comprising methylating CpG containing oligonucleotides prior to administration to a subject; and treating or preventing a viral infection in a subject. The targeting means is selected from cholesterol, virosome, lipid, or a target cell specific binding agent. The coligonucleotides described in the invention have antiinflammatory,

```
cc and containing at least one unmethylated CpG dinuclectide. The oligonuclectide is capable of interfering with the activity of viral or cellular transcription factors and containing a consensus immunoinhibitory CpG motif having the formula: 5'GCGXnGCG3', where X is a nucleotide and n is 0-50. Also included are an oligonucleotide delivery complex (comprising the oligonucleotide above and a targeting means), a comparamentical composition (comprising the oligonucleotide above and a cargeting means), a comparamentical carrier), activating a subject's B cells, activating a subject's natural killer cells, treating (preventing or ameliorating) and subject's natural killer cells, treating (preventing or ameliorating) and issue deficiency in a subject, vaccinating or subject, treating a clisance therapy (comprising methylating CpG containing or performing antisense therapy (comprising methylating CpG containing oligonucleotides prior to administration to a subject), in vivo diagnoses cusing oligonucleotides prior to administration to a subject in vivo diagnoses conjugnucleotides prior to administration to a subject and treating or preventing a viral infection in a subject. The oligonucleotide is useful for treating diseases associated with immune system activation including systemic lupus erythematosus or sepsis, or for treating, preventing, or coligonucleotide is also useful for treating or preventing viral coligonucleotide is also useful as a vaccine. The present sequence is an immune coligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    systemic lupus erythematosus; sepsis; tumour; cancer; viral infection; bacterial infection; fungal infection; cytostatic; virucidal; antibacterial; fungicidal; antiinflammatory; dermatological; immunosuppressive; vaccine; gene therapy; phosphorothicate backbone; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Mitogenic CpG oligonucleotide ODN1585 used in B-cell activation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Immunomodulatory; CpG dinucleotide; immune system deficiency;

The invention provides novel oligonucleotides containing unmethylated CpG dinucleotides and therapeutic utilities based on their ability to dinucleotides an immune response in a subject. Oligonucleotides of the invention are useful for treating, preventing or ameliorating an immune system deficiency or a tumour, cancer, viral, bacterial or fungal infection. They are useful for treating diseases associated with immune system activation including systemic lupus erythematosus or sepsis. They are also useful as vaccines to boost subject's immune system. The invention is also useful in gene therapy. The present sequence is a CpG oligonucleotide used to stimulate B-cells Note: This sequence is acted to be the same as that shown as SEQ ID NO: I in page 18 of the specification. However these sequences differ.
                                                                                                                                                                                                                         New oligonucleotide comprises at least one unmethylated CpG dinucleotide,
                                                                                                                                                                                                                                          useful for treating, preventing, or ameliorating an immune system deficiency or a tumor, cancer, viral, bacterial, or fungal infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CpG dinucleotide; gene therapy a; vaccine; cancer; viral infection; fungal infection; bacterial infection; parasitic infection; systemic lupus erythematosus; sepsis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CpG immunomodulatory oligo, ODN 1585 used in B cell stimulation.

                                                                                                                                                                                                                                                                        The present invention provides oligonucleotides comprising is useful immunomodulatory unmethylated CpG dinucleotide. The invention is useful for treating, preventing and ameliorating immune system deficiencies such as systemic lupus erythematosus and sepsis, tumour, cancer, viral, bacterial and fungal infections. The invention acts as an cytostatic, virucidal, antibacterial, fungicidal, antinflammatory, dermatological and immunosuppressive agent. The invention is also useful in the production of vaccines and in gene therapy. The present sequence is a mitogenic CpG oligonucleotide used in B-cell activation. Note: This sequence is stated to be SEQ ID NO: 1 in the sequence differs from the sequence designated as SEQ ID NO: 1 in the
                                                                                                                                                               New oligonucleotide comprises at least one unmethylated CpG dinucleotide, useful for treating, preventing, or ameliorating an immune system deficiency or a tumor, cancer, viral, bacterial, or fungal infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Immune response; immune system deficiency; tumour; cancer;

Suppressing allergies, including asthma, rhinitis, urticaria and atopic dermatitis, in a subject, comprises administering a first and second dose
                                                                                                                                                                                                                                                    The invention relates to immunomodulatory oligonucleotides containing an unmethylated CpG dinucleotide. The oligonucleotide of the invention is useful in preparing a composition for treating a disease associated with an immune system activation, e.g. systemic lupus erythematosus, sepsis or viral infection. It is also useful to prepare vaccine. The present sequence is an immunomodulatory oligonucleotide used to stimulate B

                                                                                                                                                                      New immunomodulatory oligonucleotides for preventing, treating or ameliorating diseases associated with immune system deficiency or activation, e.g. cancer, viral infection, systemic lupus erythematosus or
                                                                                                                                                                                                                                                                    The present invention relates to an oligonucleotide containing at least one unmethylated CpG dinucleotide. The invention is useful in gene therapy and for preparing vaccine. The invention is also useful for preventing, treating or ameliorating diseases associated with immune system deficiency or activation such as cancer, viral, fungal, bacterial or parasitic infection, systemic lupus erythematosus or sepsis. The present sequence is a CpG immunomodulatory oligonucleotide used in B cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Immunomodulator; immune system; systemic lupus erythematosus; sepsis; viral infection; vaccine; B cell; virucide; phosphorothioate backbone.

                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                      The invention relates to a method of suppressing a symptom of an allergic response in a subject by administering a first and second dose of an immunostimulatory nucleic acid that comprises a nucleotide sequence comprising 5'-cg-3', and where the second dose is administered from 1 day to 8 weeks after the first dose. The methods and compositions of the present invention are useful for the treatment or prevention of asthma and allergy, including rhinitis, uritearia and atopic dermatitis, using an immunostimulatory nucleic acid alone or in combination with other medicaments. They can also be used in preventing bacterial and viral infections. This sequence represents an oligonucleotide used in the

                                                                                                                                                                                                                                                                                                                            The present invention relates to immunomodulatory oligonucleotides containing unmethylated CpG dinucleotides and therapeutic utilities based on their ability to stimulate an immune response in a subject. The invention is useful for treating, preventing or ameliorating immune system deficiencies such as tumor, cancer, systemic lupus erythematosus and sepsis, infections such as viral (e.g. HIV, herpes), fungal (e.g. candida sp.) and bacterial or parasitic (e.g. Leishmania, Toxoplasma) and sutcimmune diseases such as rheumatoid arthritis and multiple sclerosis. The invention is also useful in antisense therapy, as in vivo hybridization probes and as antiviral therapeutics. The present sequence is a mitogenic CpG oligonucleotide used in B-cell stimulation.
                                                                                                              Use of an immunostimulatory oligonucleotide for boosting an immune response of a subject, or for stimulating an immune response in a subject, where increases in IFN-gamma and IL-12 expression are indicators of the immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                ADX8498
                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                                                                              요
                                                                                                                                                                             The invention relates to a novel pharmaceutical composition (A) for oral administration comprising an immunostimulatory nucleic acid (1) (8-100 nucleotides in length) in a pharmaceutically acceptable carrier. The immunostimulatory nucleic acid is of the formula 5.x 1 x 2 CGX 3 x 4 3. (Where C and G are unmethylated). The carrier comprises an emulsion. A composition of the invention has immunomodulator, cytostatic, virucide, fungicide, antibacterial, antiparasitic, antihlammatory, dermatological, immunosuppressive, antiarthritic, antihlammatory, commonition is useful to treat/prevent/ammainitic, antihrheumatic, neuroprotective, and immunostimulant activity. A nucleic acid of the invention is useful to treat/prevent/ammainitic, bacterial or parasitic deficiency (e.g. tumors, cancers or viral, fungal, bacterial or parasitic infections) or a disease (e.g. systemic lupus erythematosus, sepsis, crheumatotid arthritis and multiple sclarosis) associated with immune system activation. The nucleic associate are useful as vaccine adjuvants to stimulate a subject's response to a vaccine, and for antisense therapies or as in vivo hybridization probes. The present sequence represents an immunosity and immunosity and immunosity immune immunosity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

The invention comprises a method of treating HIV by administering a CpG nucleic acid (e.g. an adjuvant-type nucleic acid or an IFN-alpha-inducing CpG nucleic acid) and an anti-HIV therapy (e.g. an inhibitor of HIV replication). The method of the invention is useful for the treatment and prevention of HIV. The present DNA sequence represents an oligonucleotide that was used to stimulate B cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Immune modulation; immunotherapy; antisense therapy; hybridization; interferon-gamma; cytokine; immune deficiency; immunostimulant; immune disorder; tumor; cancer; cytostatic; neoplasm; viral infection; virucide; infection; fungicide; bacterial infection; antibacterial; parasitic infection; antiparasitic; nucleic acid vaccine; leukemia; systemic lupus erythematosus; antiinflammatory; dermatological; immunosuppressive; sepsis; autoimmune disease; ss.

The invention relates to a method for increasing interferon (IFN)-gamma in a subject. The method involves administering an immunostimulatory oligonucleotide/delivery complex to modulate immune response of the subject. The invention is useful for treating diseases associated with immune system deficiency e.g. tumor or cancer or viral, fungal, bacterial or parasitic infections; as vaccine; for treating leukemia, systemic lupus erythematosus, sepsis and autoimmune diseases. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New modified proteinaceous composition, useful for treating e.g., tumors.
                                          Use of immunostimulatory oligonucleotide delivery complex comprising oligonucleotide linked to biodegradable delivery complex for increasing interferon-gamma levels and treating diseases associated with immune system deficiency e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ricin; (x) Asp(y); primer; mutant; mutagenesis; ss; vascular leak syndrome; VLS; cancer; immunotoxin; IT; cytokine; RTA; aphasia; myalgia; fatigue; hypotension; rhabdomyolysis; MAb; ribosome inactivating protein; RIP; vaccine; graft vs. host disease; GVHD; non-Hodgkin's lymphoma; Hodgkin's lymphoma; cytostatic; immunosuppressive; myloma; tumour; monoclonal antibody.

The invention discloses a new modified proteinaceous composition which

```
Computers a protein marking a hypersy, sequence computers a protein alters the ability of a (x)App(y) sequence to induce Vascular Leak Syndrome (VLS). The present invention relates to the filed to physical provides immunofoxins (TTS) and cancer biology. The invention provides immunofoxins (TTS) and cytokines, methods for producing them, which have been mutated to lack amino acid sequences which induce VLS or other side effects. Also calaimed is a ricin A chain toxin (RTA) with a reduced ability to promote toxicity in a patient, where at least one amino acid flanking the coxicity in a patient is further (x)Asp(y) sequence is altered. The toxicity in a patient is further of defined as VLS, aphasia, myadigia, fatigue, hypotension or rhabdomyolysis. The are hybrid molecules consisting of monoclonal antibodies (NAbs), or other cell binding ligands, which are biochemically or genetically linked to toxins, toxin subunits or ribosome inactivating proteins (RIPs) from plants, fungi or bacteria. The modified proteinaceous composition is useful for treating (e.g. vaccine) graft vs. host disease (GVHD), non-Hodgkin's and Hodgkin's lymphoma, myloma and some solid tumours. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bacillus stearothermophilus template-dependent DNA polymerase for preparing cDNA molecule from RNA template comprises reverse transcriptase activity in the presence of magnesium ions and absence of manganese ions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PCR primer; DNA polymerase; reverse transcriptase; rabbit; tissue factor;
                                                                                                                                                                                                                                                                                                                                                           sequence presented is a primer which was used to mutate the RTA (x)Asp(y)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a purified thermostable template-dependent DNA polymerase from Bacillus stearchtermophilus comprising reverse transcriptase (RT) activity in the presence of magnesium ions at a concentration of 1 mM and in the substantial absence of manganese in The DNA polymerase is useful for preparing cDNA molecules from RNA perplates and for amplifying a nucleic acid. The present sequence is a PCR primer for rabbit tissue factor (RTF). This sequence was used to demonstrate the activity of the DNA polymerase of the present invention
a protein having a (x) Asp(y) sequence and at least one amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     concoding enzymes associated with drug metabolism. The invention relates encoding enzymes associated with drug metabolism. The invention relates concoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at least one polymorphism may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ4317-ABZ50807 using a variety of detection assays, including hybridisation assays, nucleic acid evaluating and screening drugs using genetic polymorphism data, particularly that relating to single nucleotide polymorphisms (SNPs), may be used in studying the relationship between DNA sequence variations and human diseases, conditions, and responses to drugs. SNPs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases. SNPs are particularly useful in the above respects as they are stable in populations, occur frequently, and have lower mutation rates than other genome variations

c such as repeating sequences. The detection and analysis of polymorphisms in genes encoding drug metabolising enzymes allows the customisation of drug therapies based upon the genetic profile of individual patients.

This would not only take the guesswork out of selecting the drug with the care the likelihood of adverse reactions, thereby increasing safety.

CC greatest therapeutic effect for a particular patient, but would also cereduce the likelihood of adverse reactions, thereby increasing safety.

CC approval processes. For example, individuals could be selected for capable of responding to a particular drug or drug class, and previously failed drug candidates could be revived if they were matched with more capable of responding to a particular drug or drug class, and previously failed drug candidates could be revived if they were matched with more compropriate patient populations. The methods, data and compositions of the invention may therefore lead to a an increase in the range of possible drug trials, the time taken for a drug to be approved, the length of time patients are on medication and the number of different companions, failed drug trials, the time taken for a drug to be approved, the length of time patients are on medication and the number of different companions a patient needs to take before finding an effective therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying individuals having a polymorphism, useful for determining the effectiveness or side effect of a drug or treatment protocol, comprises detecting at least one polymorphism in the drug metabolizing enzyme nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; drug metabolising enzyme; gene; drug metabolism; chromosome 22; polymorphic site; drug evaluation; drug screening; genotyping; genetic profiling; therapeutic customisation; adverse reaction; clinical trial; drug approval; single nucleotide polymorphism; SNP; ds.

Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes encoding enzymes associated with drug metabolism. The invention relates concoding enzymes and compositions for identifying individuals who have at least to methods and compositions for identifying enzyme-encoding genes. The polymorphisms may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ43217-ABZ50887 using a variety of detection assays, including hybridisation assays, nucleic acid arrays and PCR-based methods. The invention also encompasses methods of evaluating and screening drugs using genetic polymorphism data, particularly that relating to single nucleotide polymorphisms (SNPs), may be used in studying the relationship between DNA sequence variations and human diseases, conditions, and responses to the above respects as they are stable in populations, occur frequently, and have lower mutation rates than other genome variations such as repeating sequences. The detection and analysis of polymorphisms (SNPs would not only take the guesswork out of selecting the drug with the such as repeating sequences. The detection and analysis of polymorphisms in genes encoding drug metabolising enzymes allows the customisation of cup therapies based upon the genetic profile of individual patients. This would not only take the guesswork out of selecting the drug discovery and arched for reduce the likelihood of adverse reactions, thereby increasing safety. Methods of the invention are also useful in the drug discovery and approval processes. For example, individuals could be selected for clinical trials only if their genetic profiles indicate that they are capable of responding to a particular drug or drug class, and previously the invention may therefore lead to a mincrease in the range of genetic possible drug candidates could be revived if they were matched with more any therefore lead to a mincrease in the number of adverse drug the invention any therefore lead to a mincrease of drug trages of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              medications a patient needs to take before finding an effective therapy

primers used in methods for amplifying a nucleic acid segment. The branched modular primer comprises of front and back oligonucleotide modules. The front module (FM) and back module (BM) comprise of a stem segment having a sequence that is the same from module to module and an arm segment having a sequence that varies from module to module arm of the back and front modules are annealed to a template which contains the priming site. These modules are designed for priming sites in lambda phage DNA. The composition is useful for amplifying a nucleic acid profireading amplification primer PR2-379 used for improving Bacteriophage lambda reverse priming site 19379 specificity
                                                                                                                                                                                                                                                             New composition comprising front and back oligonucleotide modules, each module has a stem and an arm segment with varying or constant sequences, useful for amplifying nucleic acid segments such as in polymerase chain
                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to compositions for branched modular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  y Match 70.5%; Score 13.4; DB 4; Length 22; Local Similarity 93.3%; Pred. ```
(A) with modified metabolic pathways comprising: (a) genetic modification of a microorganism to inhibit production or consumption of a metabolite when it is grown on a defined medium, thus affecting its ability to grow; (b) growing the modified organism in the defined medium so that evolution can occur, optionally with addition of a co-substrate to allow evolution; and (c) selecting as (A) cells able to grow on the medium, optionally in presence of co-substrate. The evolved microorganisms (A), or evolved proteins (I) expressed by them, are useful in biotransformation processes, especially those involving NaDPH-dependent enzymes, particularly synthesis of amino acids (Met. Cys. Thr. Lys or Ile) but also synthesis of mucleic acids or lipids, and metabolism of sugars. (A) provide more efficient production of selected metabolism of sugars. (A) strains. This sequence represents a nucleic acid molecule used in the method of the invention.
                                        The invention relates to a method for preparing evolved microorganisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Seguence 30 BP; 7 A; 8 C; 9 G; 6 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                        The present invention describes a method for amplifying a template nucleic acid segment (I), comprising annealing (I) to a branched primer having front (FOM) and back oligonucleotide modules with arm segments complementary to a site in (I), extending the arm of FOM to form an initial extension strand, annealing the strand to a reverse primer (RP), sectonding RP to form second initial extension strand, and amplifying the second strand. The method can be used for amplifying nucleic acid segments, useful in genome mapping, biomedical research and clinical diagnostics. The method eliminates the need for custom primer synthesis in methods to amplify nucleic acid segments. The modular combination of just a few oligonucleotides essentially mimics the performance of a conventional, custom-made primer by matching a sequence of a priming site in the template. AMPTA990 to AMPTA979 represent oligonucleotides espectation and appliances and a priming site and appliance of the complete of the proposition of the conventional of the complete of the conventional of the conventional of the convention of the conv
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 used in the exemplification of the present invention. be used in the treatment of cancer, such as: hepatocellular cancer, breast cancer, colon cancer, prostate cancer, lung cancer, bladder cancer, ovarian cancer, renal cancer, glioblastoma, pancreatic cancer and non-Hodgkin's lymphoma. The present nucleic acid represents a human survivin-specific siRNA sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention comprises dsRNA oligomeric sequences which are targeted to the human survivin gene. The dsRNA oligomeric compounds of the invention are useful for inhibiting expression of the human survivin gene, and can be used in the treatment of cancer, such as: hepatocellular cancer, breast cancer, colon cancer, prostate cancer, lung cancer, bladder cancer, in the cancer, prostate cancer, lung cancer, bladder non-Hodgkin's lymphoma. The present nucleic acid represents a human survivin-specific siRNA sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel double-stranded compound, modulating expression of human survivin, useful for treating condition associated with survivin expression or overexpression, such as breast cancer, colon cancer, lung cancer, bladder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          survivin; antisense therapy; gene silencing; cancer; cytostatic; breast tumor; colon tumor; prostate tumor; lung tumor; bladder tumor; ovary tumor; renal tumor; pancreas tumor; non-hodgkin lymphoma; hepatcocallular carcinoma; ss; siRNA; short interfering RNA;

response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immuno response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophlus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the

The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immunostimulatory content immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. herpesviridae, retroviridae haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the present sequence may have a phosphorothioate backbone

administering at least one antiangiogenesis in a subject, Compitating administering at least one antiangiogenic mucleic acid molecule. Also included is a kit comprising a first container housing the antiangiogenic mucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, anglofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.
Angiogenesis inhibitor; ss; angiogenesis; solid tumour growth; tumour metastasis; precancerous lesion; rheumatoid arthritis; psoriasis; diabetic retinopathy; retinopathy of prematurity; macular degeneration; corneal graft rejection, neovascular glaucoma; retrolental fibroplasia; rubeosis; Osler-Webber Syndrome; myocardial angiogenesis; plaque neovascularisation; telangiectasia; haemophiliac joint; angiofibroma; wound granulation; intestinal adhesion; atherosclerosis;

musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resources/documents/dnares/). The DNA
was bydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polynucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gi|4732114|gb|AR129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to

/note="Organ: Zygotic Embryo and Megagametophyte; Somatic
Embryo; Vector: pCMV-SPORT 6.1; Site_1: Not1; Site_2:
EcoRV; tissue: Whole megagametophytes isolated from pine
seeds, Whole embryos excised from these megagametophytes;
whole somatic embryos and suspensor tissue from tissue
culture, isolated from call line Al2. Pooled RNA from
zygotic embryos, megagametophytes, and somatic embryos was
used for library construction. Pine conse were harvested
weekly from open-pollinated 7-56 mother trees, collections
occurred from 7/0/10 until 10/15/02. Whole
megagametophytes were first isolated from pine seeds, and
whole embryos excised from these megagametophytes each was
flash frozen. Embryo development was assessed using the
system of Pullman et al (Pullman GS, Johnson S, Peter G,
cairney J, Xu N. 2003. Loblolly Pine somatic
embryogenesis: development of a maturation medium and
resulting embryo quality. Plant Cell Reports 21:74-758

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gal electrophoresis. Vector DNA was prepared from a derivative of pWAP2 (gil #742114[ph]AP129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                            site 'www.zmdb.iastate.edu' and follow the links for 'RescueMu.' Grid P was grown at Molokai in 2002. DNB was extracted from leaf strips, double digested using BamHI and BgllI, and ligated to form circular plasmids. DH10B were transformed and then screened on LB plates with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.05 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were lidated to the blunt ends in high molar excess. The adaptored DNA was purified and size selected for a 9.5 to 10.5 kb range using preparative agarose gel
                                                                                                                                                                                                                                                                                                                                 ö

electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli X.10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        musculus C57BL/601211, was obtained from the Jackson Laboratory Mouse DNA Resource
Laboratory Mouse DNA Resource
Laboratory Mouse DNA Resource
Laboratory Mouse DNA Resource
Laboratory Mouse Laboratory Resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                     10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Inductible C7/Dector DNA Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gi|4732114|gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xii0-Gold (Stratagene) cells and selected for ampicillin resistance."

The DNA was hydrodynamically sheared by repeated passage through a 0.05 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel

electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

Xhol; Unidirectional cloning. EcoRI side has T3 primer and predominantly 5' reads. T7 primer on Xhol side of insert.
Nitrogen starvation library. Cells were inoculated into minimal medium and grown for two days with shaking (150 rpm) at room temperature. Culture was harvested, blended, inoculated into minimal medium as above for 24 h. Cells were harvested, washed with water and inoculated into minimal medium base lacking nitrogen source for 6 h. Sequences were processed by one of two methods. Where a full-length alignment to the M. grisea genome sequence was available, the EST sequence was trimed according to the alignment, otherwise sequence quality was assessed using phredPhrap version 991019 and trimmed according to phd files (0.05) and for vector seqs."

/note="organ: colon; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; lst strand cDNA was prepared from colon adenocarcinoma, and was then primed with a Not I oligo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3
vector. Library is normalized. Library was constructed by Bento Soares and M. Fatima Bonaldo. "

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pMAP120/T2.11, a copy.number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XIIO-Gold (Stratagene) cells and selected for ampicillin resistance."

/lab host="DH108"
/clone_lib="NCI_CGAP_GC4"
/note="Vectors: pT7130-Pec (Pharmacia) with a modified
polylinker; lst strand cDNA was prepared from 3 pooled
germ cell tumors, and was then primed with a Not I -
oligo (dT) primer: Double-stranded cDNA was ligated to Eco
RI adaptors (Pharmacia), digested with Not I and cloned
into the Not I and Eco RI sites of the modified pT773
vector. Library is normalized. Library was constructed by
Bento Soares and M. Patima Bonaldo. "
